**CORRUPTION
PERCEPTIONS
INDEX 2010**

Transparency International (TI) is the global civil society organisation leading the fight against corruption. Through more than 90 chapters worldwide and an international secretariat in Berlin, TI raises awareness of the damaging effects of corruption and works with partners in government, business and civil society to develop and implement effective measures to tackle it.

TRANSPARENCY AND ACCOUNTABILITY ARE CRITICAL TO RESTORING TRUST AND TURNING BACK THE TIDE OF CORRUPTION

With governments committing huge sums to tackle the world's most pressing problems, from the instability of financial markets to climate change and poverty, corruption remains an obstacle to achieving much needed progress.

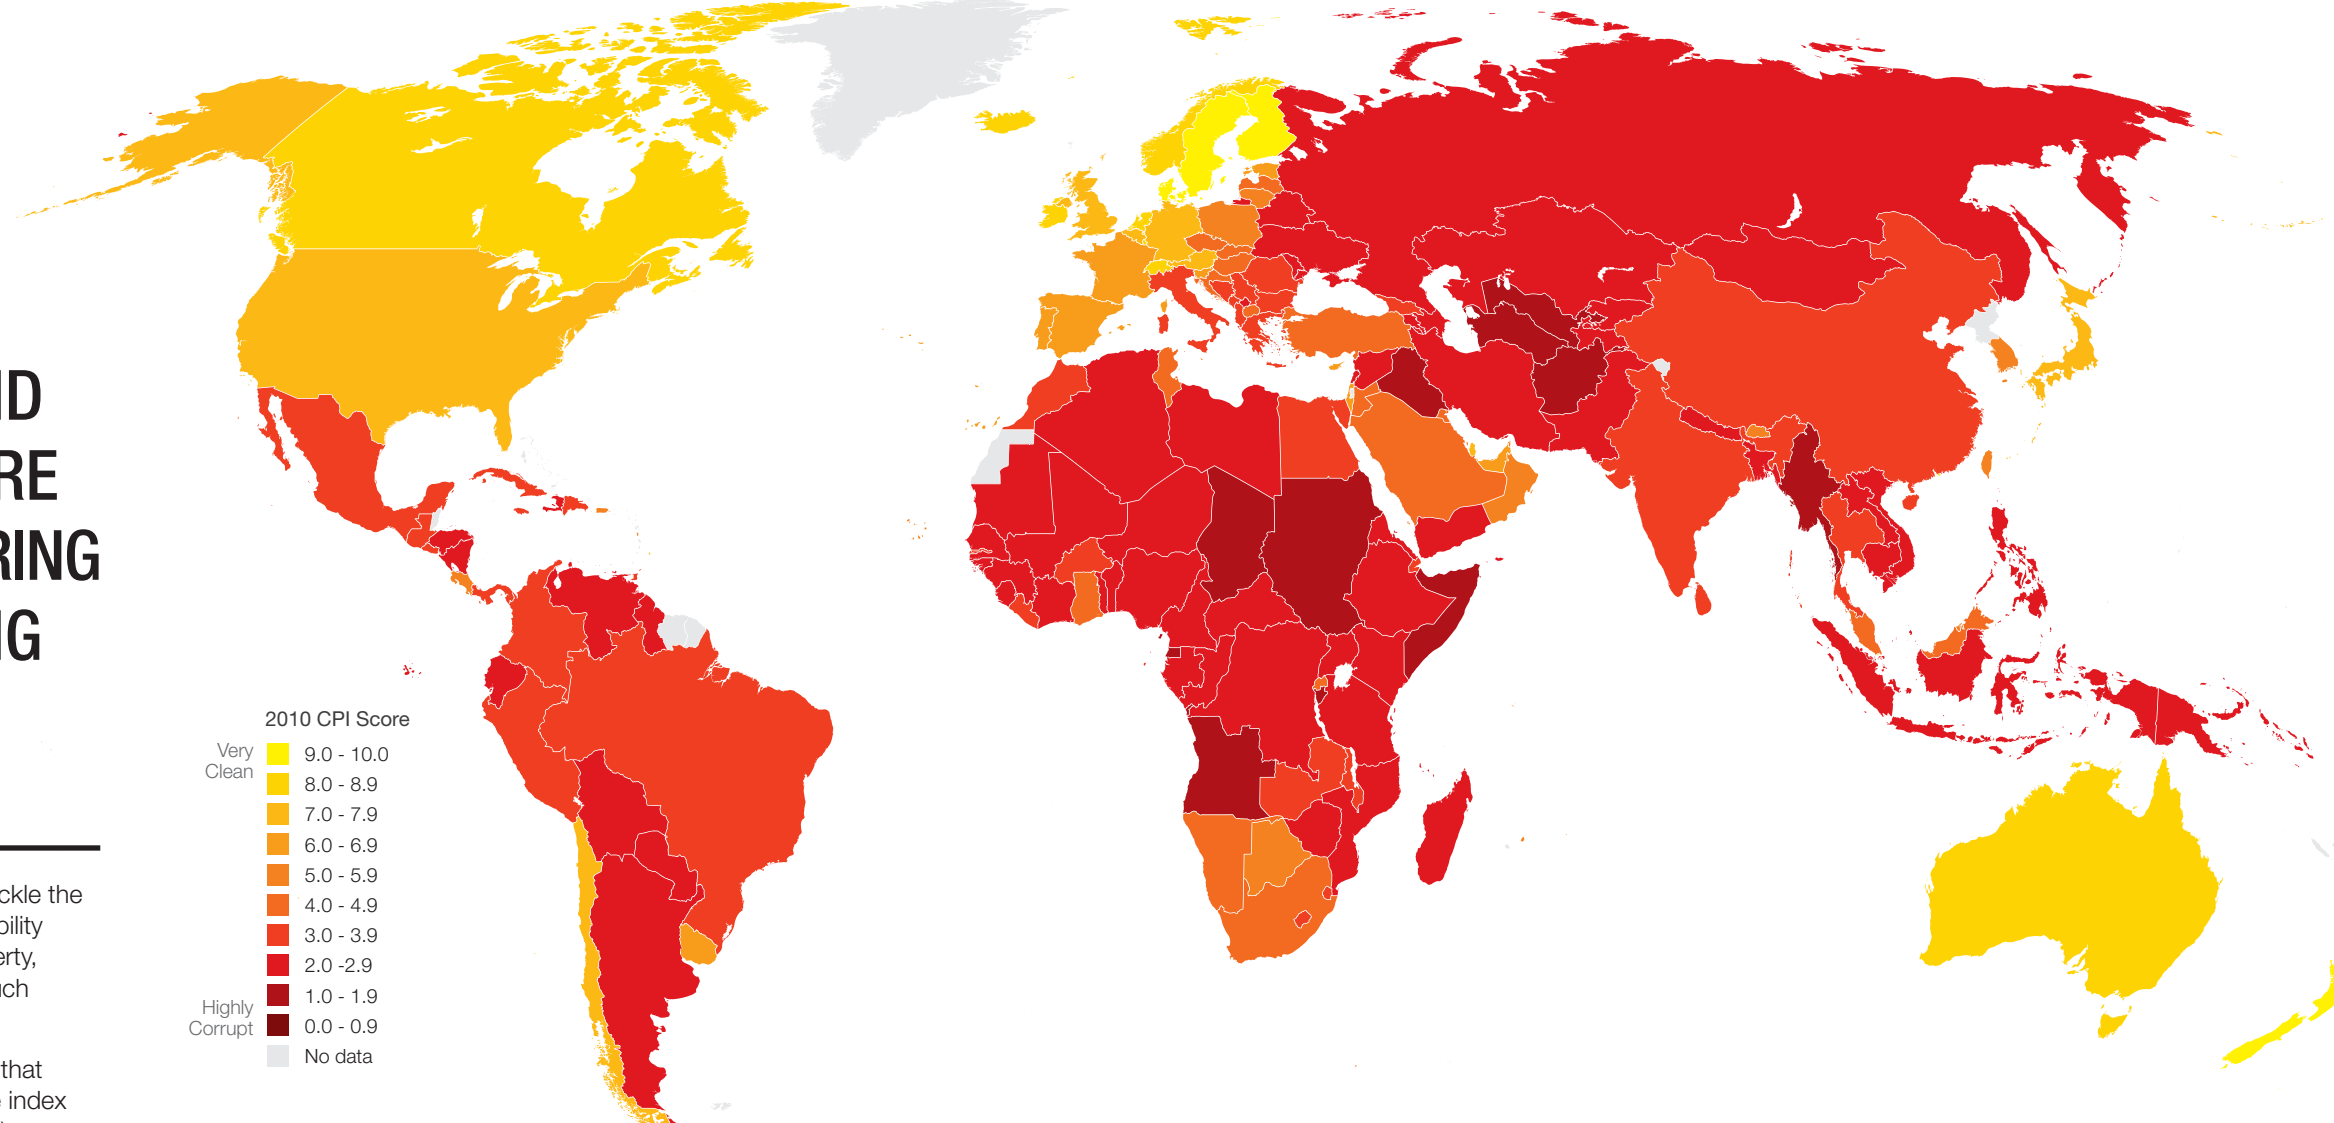

The 2010 *Corruption Perceptions Index* shows that nearly three quarters of the 178 countries in the index score below five, on a scale from 10 (very clean) to 0 (highly corrupt). These results indicate a serious corruption problem.

To address these challenges, governments need to integrate anti-corruption measures in all spheres, from their responses to the financial crisis and climate change to commitments by the international community to eradicate poverty. Transparency International advocates stricter implementation of the UN Convention against Corruption, the only global initiative that provides a framework for putting an end to corruption.

Denmark, New Zealand and Singapore are tied at the top of the list with a score of 9.3, followed closely by Finland and Sweden at 9.2. At the bottom is Somalia with a score of 1.1, slightly trailing Myanmar and Afghanistan at 1.4 and Iraq at 1.5.

Notable among decliners over the past year are some of the countries most affected by a financial crisis precipitated by transparency and integrity deficits. Among those improving in the past year, the general absence of OECD states underlines the fact that all nations need to bolster their good governance mechanisms.

The message is clear: across the globe, transparency and accountability are critical to restoring trust and turning back the tide of corruption. Without them, global policy solutions to many global crises are at risk.

WHAT IS THE CORRUPTION PERCEPTIONS INDEX?

Transparency International (TI) defines corruption as the abuse of entrusted power for private gain. This definition encompasses corrupt practices in both the public and private sectors. The *Corruption Perceptions Index* (CPI) ranks countries according to perception of corruption in the public sector. The CPI is an aggregate indicator that combines different sources of information about corruption, making it possible to compare countries.

The 2010 CPI draws on different assessments and business opinion surveys carried out by independent and reputable institutions¹. It captures information about the administrative and political aspects of corruption. Broadly speaking, the surveys and assessments used to compile the index include questions relating to bribery of public officials, kickbacks in public procurement, embezzlement of public funds, and questions that probe the strength and effectiveness of public sector anti-corruption efforts.

For a country or territory to be included in the index a minimum of three of the sources that TI uses must assess that country. Thus inclusion in the index depends solely on the availability of information.

Perceptions are used because corruption – whether frequency or amount – is to a great extent a hidden activity that is difficult to measure. Over time, perceptions have proved to be a reliable estimate of corruption. Measuring scandals, investigations or prosecutions, while offering ‘non-perception’ data, reflect less on the prevalence of corruption in a country and more on other factors, such as freedom of the press or the efficiency of the judicial system. TI considers it of critical importance to measure both corruption and integrity, and to do so in the public and private sectors at global, national and local levels.² The CPI is therefore one of many TI measurement tools that serve the fight against corruption.

¹For detailed information on the sources of information please see Annex B and visit our website at www.transparency.org/cpi

²Examples include National Integrity System assessments, which evaluate the degree of integrity, transparency and accountability in a country's anti-corruption institutions, and the Bribe Payers Index, which evaluates expert views of the supply of foreign bribery.

2010 FACTS

The 2010 CPI measures the degree to which public sector corruption is perceived to exist in 178 countries around the world. It scores countries on a scale from 10 (very clean) to 0 (highly corrupt).

The 2010 results are drawn from 13 surveys and assessments published between January 2009 and September 2010.

The 2010 CPI covers two countries fewer than last year's edition. The slight change resulted from individual sources adjusting the range of countries they assess. These adjustments in coverage made it possible to include Kosovo for the first time, but led to the exclusion of Saint Lucia, Saint Vincent and the Grenadines, and Suriname, for which only two sources of information were available this year.

Given its methodology, the CPI is not a tool that is suitable for trend analysis or for monitoring changes in the perceived levels of corruption over time for all countries. Year-to-year changes in a country/territory's score can result from a change in the perceptions of a country's performance, a change in the ranking provided by original sources or changes in the methodology resulting from TI's efforts to improve the index.

If a country is featured in one or more specific data sources for both of the last two CPIs (2009 CPI and 2010 CPI), those sources can be used to identify whether there has been a change in perceived levels of corruption in that particular country compared to the previous year. TI has used this approach in 2010 to assess country progress over the past year and to identify what can be considered to be a change in perceptions of corruption. These assessments use two criteria:

- (a) there is a year-on-year change of at least 0.3 points in a country's CPI score, and
- (b) the direction of this change is confirmed by more than half of the data sources evaluating that country.

Based on these criteria, the following countries showed an improvement from 2009 to 2010: Bhutan, Chile, Ecuador, FYR Macedonia, Gambia, Haiti, Jamaica, Kuwait and Qatar. The following countries showed deterioration from 2009 to 2010: the Czech Republic, Greece, Hungary, Italy, Madagascar, Niger and the United States.

ANNEX A: SHORT METHODOLOGICAL NOTE

The *Corruption Perceptions Index* (CPI) 2010 is an aggregate indicator that brings together data from sources that cover the past two years. For the 2010 CPI, this includes surveys published between January 2009 and September 2010.

DATA SOURCES:

- The 2010 CPI is calculated using data from 13 sources by 10 independent institutions. All sources measure the overall extent of corruption (frequency and/or size of bribes) in the public and political sectors, and all sources provide a ranking of countries, i.e. include an assessment of multiple countries.
- Evaluation of the extent of corruption in countries/territories is done by two groups: country experts, both residents and non-residents, and business leaders. In the 2010 CPI, the following seven sources provided data based on expert analysis: African Development Bank, Asian Development Bank, Bertelsmann Foundation, Economist Intelligence Unit, Freedom House, Global Insight and the World Bank. Three sources for the CPI 2010 reflect the evaluations by resident business leaders of their own country, IMD, Political and Economic Risk Consultancy, and the World Economic Forum.
- For CPI sources that are surveys, and where multiple years of the same survey are available, data for the past two years is included.
- For sources that are scores provided by experts (risk agencies/country analysts), only the most recent iteration of the assessment is included, as these scores are generally peer reviewed and change very little from year to year.

STEPS TO CALCULATE THE CPI:

1. The first step to calculate the CPI is to standardise the data provided by the individual sources (that is, translate them into a common scale). We use what is called a matching percentiles technique that takes the ranks of countries reported by each individual source. This method is useful for combining sources that have different distributions. While there is some information loss in this technique, it allows all reported scores to remain within the bounds of the CPI, i.e. to remain between 0 and 10.
2. The second step consists of performing what is called a beta-transformation on the standardised scores. This increases the standard deviation among all countries included in the CPI and makes it possible to differentiate more precisely countries that appear to have similar scores.
3. Finally, the CPI scores are determined by averaging all of the standardised values for each country.

RESULTS:

- The CPI score and rank are accompanied by the number of sources, the highest and lowest values given to every country by the data sources, the standard deviation and the confidence range for each country.
- The confidence range is determined by what is called a bootstrap (non-parametric) methodology, which allows inferences to be drawn on the underlying precision of the results. A 90 per cent confidence range is then established, where there is only a five per cent probability that the value is below and a five per cent probability that the value is above this confidence range.
